EDUCATION

Georgia Institute of Technology

Atlanta, GA

B.S. in Computer Science, B.S. in Mathematics – GPA: 4.0/4.0

May 2026

M.S. in Computer Science – GPA: 4.0/4.0

May 2027

- **Relevant Coursework:** Honors Algorithms, Data Structures, Systems & Networks, Database Systems, Computer Networking, Computer Architecture, Artificial Intelligence, Machine Learning, Deep Learning (grad)
- **Awards:** Y Combinator Startup School 2026, AIME 4x Qualifier, USA Physics Olympiad Semifinalist

EXPERIENCE

Meta

May 2026 – Aug. 2026

Software Engineering Intern

Menlo Park, CA

- Developed a decision-tree analysis engine in **Python, C++, and PHP** that automatically identifies obsolete deployment safeguards candidates, enabling large-scale cleanup across Meta's codebase used by **10K+ engineers**
- Built an end-to-end AI-assisted cleanup pipeline that automates safeguard candidate discovery, security validation, and reviewer-ready code changes, saving **100s of hours** of manual investigation and cleanup

College of Computing at Georgia Tech

Jan. 2025 – Present

Head Algorithms Teaching Assistant

Atlanta, GA

- Design and publish algorithms assignments and solutions for **300+ students**, aligning with course learning goals and strengthening understanding of graph theory, dynamic programming, and time complexity analysis
- Responded to **500+** student questions across EdStem, emails, and office hours with quick turnaround, improving clarity and accessibility of course support

Emory School of Medicine

Sep. 2025 – Dec. 2025

Software Engineering Intern

Atlanta, GA

- Developing an offline-capable data collection system using **IndexedDB** to enable healthcare staff to record patient data in rural Georgia without reliable internet
- Implementing a client-server architecture with **RSA-AES encryption** to ensure end-to-end HIPAA compliance, securing sensitive health records during offline storage and synchronized transmission

Amazon

May 2025 – Aug. 2025

Software Development Engineer Intern

Bellevue, WA

- Cut business onboarding time by **90% (20 to 2 business days)** by building a CI/CD-driven workflow automation system with a self-service form in Java and TypeScript
- Automated deployment and integration pipelines with AWS Lambda and DynamoDB, replacing manual email processes with API-based verification

PROJECTS

Crucible | *Python, Docker* – Finalist, AGI House AutoResearch Hackathon

Jul. 2026 – Jul. 2026

- Built a secretless credential proxy and deny-all egress allowlist so agents run untrusted model-generated code with no secrets in the container, with every allow/block decision audited
- Shipped a Best-of-N runner that scores up to **100** parallel agents on held-out cases in fresh sandboxes, exposing reward hacking as an in-sandbox vs. held-out score gap

Poker Strategy Evaluation Engine | *Python, FastAPI*

Jan. 2026 – Mar. 2026

- Built a backend system to evaluate poker hands against over **1000** simulated opponent ranges per request with sub-**200ms** response times, exposed with a schema-validated FastAPI service
- Designed a reproducible decision pipeline that computes hand strength and recommendations, validated through unit tests and structured logging to support debuggable analysis

TECHNICAL SKILLS

Languages: Python, Java, C++, C, JavaScript, TypeScript, PHP, SQL, HTML/CSS, XML

Frameworks: React, Next.js, Node.js, GraphQL, Django, Flask, REST APIs, Nginx

Databases: MySQL, PostgreSQL, MongoDB, Firebase

Cloud & Tools: AWS (Lambda, DynamoDB, CDK, CloudWatch), Docker, Linux, Git/GitHub, CI/CD

AI & ML: PyTorch, NumPy, Pandas, LLM APIs (Anthropic, OpenAI), agentic dev tooling (Claude Code, Cursor)
